☑ Configure logging settings from the Visual Logger window, or using the configuration file that is generated in the application directory
☑ Setup log groups and filter them
☑ Set log levels
☑ Choose where and how to save the log file
☑ Upload the log file
☑ Query the log file and analyze it
☑ Attach a callback procedure to the log events and receive notification when a change is made
☑ Use the Visual Logger attached to another application, use the configuration file or manually configure the ActiveX server from within your own code
☑ Use the properties of a log event to get the log data
☑ Send a log file to a different machine
☑ The Visual Logger can be deployed with your application, either as a separate application or in the code. In this case, the application will automatically retrieve the log data from a log file or from the attached Visual Logger server.
☑ The Visual Logger can be run as an out-of-process server (without any additional libraries or tools). This approach has proven to be more stable, and is also faster.
☑ Receive notification about a change to any of the log levels, including the user notification, so that the developer can react and continue the process
☑ Disable logging temporarily and manually perform setup of the log data
☑ Global log filtering and scheduling, so the logs are only displayed during development phases. Disable logging when your code is finished
☑ Modify the log at runtime and keep the changes
☑ Save the log to a proprietary log file format or to a text file
☑ Set the log color and indenting
☑ Set the log window to foreground or minimized to the system tray, depending on the preferred development environment.
☑ Export the log to a text file or to a proprietary file format " What Is The Purpose Of Build Automation?
